5. ServiceNow Developer Setup
6. Project Implementation in ServiceNow
7. Screenshots of Output
8. Conclusion

1. Introduction

The **Employee ID Card Request** project in ServiceNow is developed to simplify and automate the process of requesting employee ID cards within an organization. Organizations frequently receive requests for new ID cards, replacement cards for lost or damaged IDs, renewal of expired cards, and updates due to changes in employee information. Handling these requests manually through emails or paper forms often results in delays, approval bottlenecks, lack of visibility, and increased administrative effort.

This solution leverages the ServiceNow platform to automate the complete lifecycle of an Employee ID Card Request. Employees can submit requests through the **Service Catalog**, where the system validates the entered information, creates the request record,

automatically routes the request to the Reporting Manager for approval, and sends email notifications at every stage of the workflow.

Once the manager approves the request, the system automatically notifies the employee through email that the request has been approved. The request is then assigned to the HR or Administration team responsible for preparing and issuing the ID card. If the manager rejects the request, the employee receives a rejection email containing the current status and rejection comments.

The project integrates several ServiceNow components including:

- Service Catalog
- Catalog Variables
- Flow Designer
- Approval Workflows
- Email Notifications

These components work together to provide a centralized, secure, and automated request management solution.

Benefits

- Faster processing of employee ID card requests
- Automatic manager approval workflow
- Automatic email notifications for approval and rejection
- Reduced manual work for HR teams
- Real-time request status tracking
- Complete audit trail of approvals
- Improved employee experience
- Better compliance with organizational policies
- Scalable workflow for future enhancements

2. Project Objectives

The primary objective of this project is to automate the Employee ID Card Request process using the ServiceNow platform. The application minimizes manual effort while ensuring requests are processed accurately, securely, and efficiently.

The specific objectives are:

- Develop a centralized Service Catalog for Employee ID Card Requests.
- Allow employees to request New, Replacement, Renewal, or Temporary ID Cards.
- Design user-friendly request forms using Catalog Variables.
- Store request information in a custom Employee ID Card Request table.
- Automatically route requests to the Reporting Manager for approval.

- Send email notifications after request submission.
- Send approval email when the manager approves the request.
- Send rejection email when the manager rejects the request.
- Automatically assign approved requests to the HR/Administration team.
- Track request status throughout the lifecycle.
- Generate reports for monitoring request processing and SLA compliance.
- Maintain audit history for every request.

3. Key Features

The proposed system includes the following features:

- Employee ID Card Request Service Catalog
- Request Types:
 - New ID Card
 - Replacement ID Card
 - Renewal Request
 - Lost ID Card
 - Damaged ID Card
- Dynamic Catalog Variables
- Flow Designer Automation
- Manager Approval Workflow
- Automatic Email Notifications
- Approval and Rejection Notifications
- Request Status Tracking
- Custom Employee ID Card Request Table
- SLA Tracking
- Role-Based Access Control

4. Project Milestones

Milestone 1: Service Catalog Creation

Objective

Create a centralized Employee ID Card Request catalog.

Activities

- Create Service Catalog

- Create Catalog Category
- Create Catalog Item
- Add descriptions and icons
- Configure user access

Milestone 2: Request Form Development

Objective

Create an intelligent request form.

Activities

- Create Catalog Variables
- Create Variable Sets
- Configure UI Policies
- Configure Client Scripts
- Apply mandatory validations
- Enable dynamic fields

Milestone 3: Workflow Automation

Objective

Automate approvals and notifications.

Activities

- Create Flow Designer Flow
- Configure Manager Approval
- Send Approval Email
- Send Rejection Email
- Create HR Assignment Task
- Update Request Status Automatically

Milestone 4: Testing

Objective

Validate complete business workflow.

Activities

- Catalog Testing
- Flow Testing
- Approval Testing
- Notification Testing
- Email Testing
- End-to-End Testing
- User Acceptance Testing (UAT)

Milestone 5: Deployment

Objective

Deploy the application.

Activities

- Validate configurations
- Publish Catalog Item
- Test Production Workflow
- Train HR Users
- Monitor Performance

5. ServiceNow Developer Setup

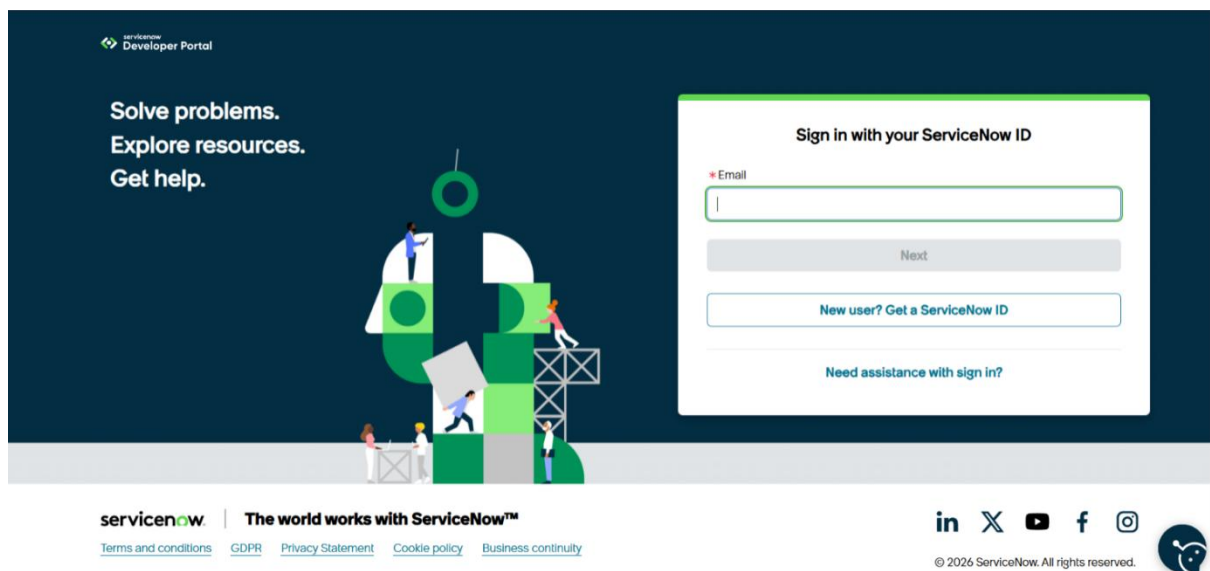

Before developing the application, create a ServiceNow Personal Developer Instance (PDI). The PDI provides a complete development environment for creating and testing ServiceNow applications.

Creating a Developer Account

1. Visit the ServiceNow Developer Portal.
2. Create a free developer account.
3. Verify your email.
4. Log in to the Developer Portal.
5. Click **Start Building**.
6. Request a Personal Developer Instance.
7. Wait until the instance is available.
8. Log in using the provided credentials.

Employee ID Card Request Workflow

1. Employee opens the Service Catalog.
2. Employee selects **Employee ID Card Request**.
3. Employee fills in the request form.
4. System creates the request record.
5. Email confirmation is sent to the employee.
6. Flow Designer sends the request to the Reporting Manager.
7. Manager approves or rejects the request.
8. If approved:
 - Approval email is sent to the employee.
 - Request is assigned to the HR/Administration team.
 - HR prepares the ID card.
 - Completion email is sent after the ID card is issued.
9. If rejected:
 - Rejection email is sent to the employee with the manager's comments.
 - Request status changes to **Rejected**.
10. Employees can track the request status anytime through the Service Portal.

5.2 Accessing Creator Studio

Once the Personal Developer Instance (PDI) is ready, ServiceNow redirects the developer to **Creator Studio**, which serves as the primary development environment for building applications using no-code and low-code capabilities. Creator Studio enables developers to rapidly design, configure, and automate business applications through an intuitive graphical interface without requiring extensive programming knowledge.

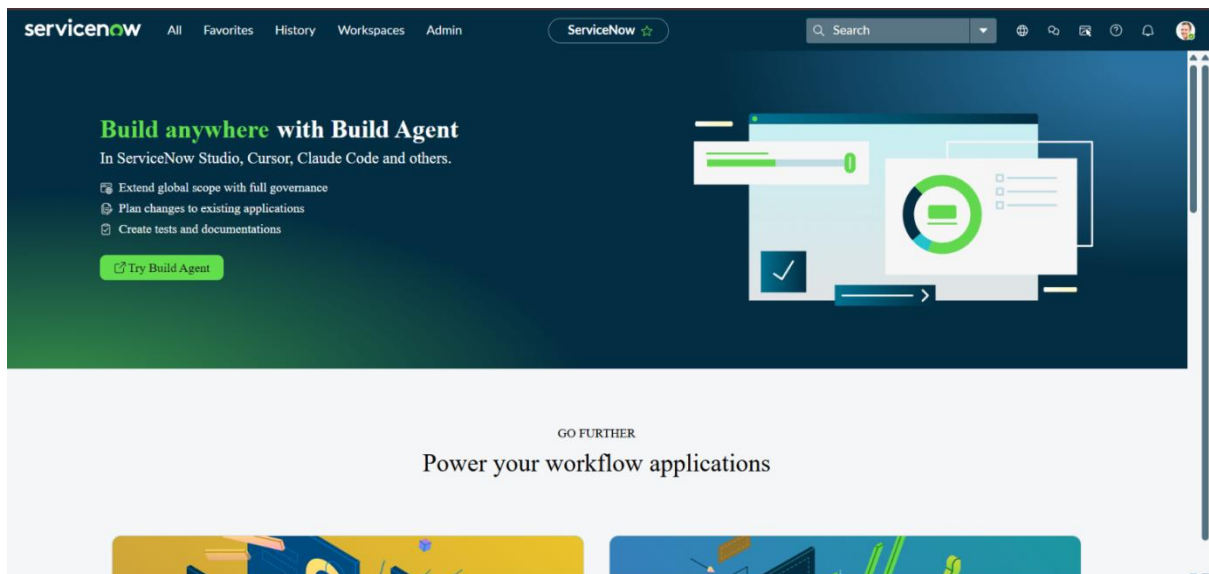

For the **Employee ID Card Request** project, Creator Studio is used to develop a complete request management application that automates the employee ID card issuance process.

The application allows employees to submit ID card requests through the Service Catalog, automatically routes requests to the reporting manager for approval, and sends email notifications based on the approval outcome.

Using Creator Studio, the following components were developed and configured:

- **Application Creation** – Created the **Employee ID Card Request** application to manage all ID card request activities.
- **Data Modeling** – Designed a custom table to securely store employee ID card request details, including employee information, request type, approval status, and request history.
- **Catalog Item Development** – Created a Service Catalog Item that allows employees to submit requests for:
 - New Employee ID Card
 - Replacement ID Card
 - Lost ID Card
 - Damaged ID Card
 - Renewal of ID Card
- **Catalog Variables** – Added variables to capture employee details such as Employee ID, Employee Name, Department, Designation, Location, Contact Number, Email Address, Request Type, Reason for Request, and supporting attachments.
- **Flow Automation** – Developed an automated workflow using **Flow Designer** to manage the complete request lifecycle.
- **Manager Approval Workflow** – Configured the flow to automatically send the submitted request to the employee's reporting manager for approval.
- **Email Notifications** – Configured automated email notifications for:
 - Request submission confirmation
 - Request sent for manager approval
 - Request approved by the manager
 - Request rejected by the manager
 - ID card issued/completed
- **Task Assignment** – Automatically assigned approved requests to the HR or Administration team for ID card preparation and issuance.
- **Status Tracking** – Configured automatic status updates such as **Submitted**, **Pending Manager Approval**, **Approved**, **Rejected**, **In Progress**, and **Completed**.
- **Reports and Dashboards** – Created reports to monitor request volume, approval time, completion status, and SLA compliance.
- **Role-Based Access Control (RBAC)** – Configured security roles so that employees, managers, and HR administrators can access only the information relevant to their responsibilities.

By using Creator Studio, the Employee ID Card Request application was developed efficiently with minimal coding. The automated approval workflow, real-time status tracking, and email notification system significantly reduce manual effort, improve processing speed, enhance transparency, and provide a seamless experience for employees, managers, and HR teams.

6.1 Service Catalog Creation

The **Service Catalog** acts as a centralized self-service portal that enables employees to submit Employee ID Card requests quickly and efficiently. In this project, a catalog item named **Employee ID Card Request** was created to provide employees with a single interface for requesting different ID card services such as a new ID card, replacement of a lost or damaged card, and renewal of an existing ID card.

The Service Catalog simplifies the request process by providing a user-friendly form where employees can enter the required information. Once the request is submitted, the system automatically creates a request record, sends a confirmation email to the employee, routes the request to the reporting manager for approval using **Flow Designer**, and updates the request status throughout the workflow. After the manager reviews the request, the employee automatically receives an email notification indicating whether the request has been **approved** or **rejected**. If approved, the request is assigned to the HR or Administration team for ID card generation and issuance.

Steps to Create the Service Catalog Item

11. Open the **Application Navigator** in the ServiceNow platform.
12. Search for **Service Catalog**.
13. Navigate to the following path:
Service Catalog → Maintain Items
14. Click the **New** button to create a new catalog item.

15. Enter the required details:

- **Catalog Item Name:** Employee ID Card Request
- **Catalog:** Service Catalog
- **Category:** Human Resources (HR) or Employee Services
- **Short Description:** Employee ID Card Request Management
- **Description:** Submit requests for a New ID Card, Replacement ID Card, Renewal, Lost ID Card, or Damaged ID Card.

16. Configure the catalog item by adding the required catalog variables such as:

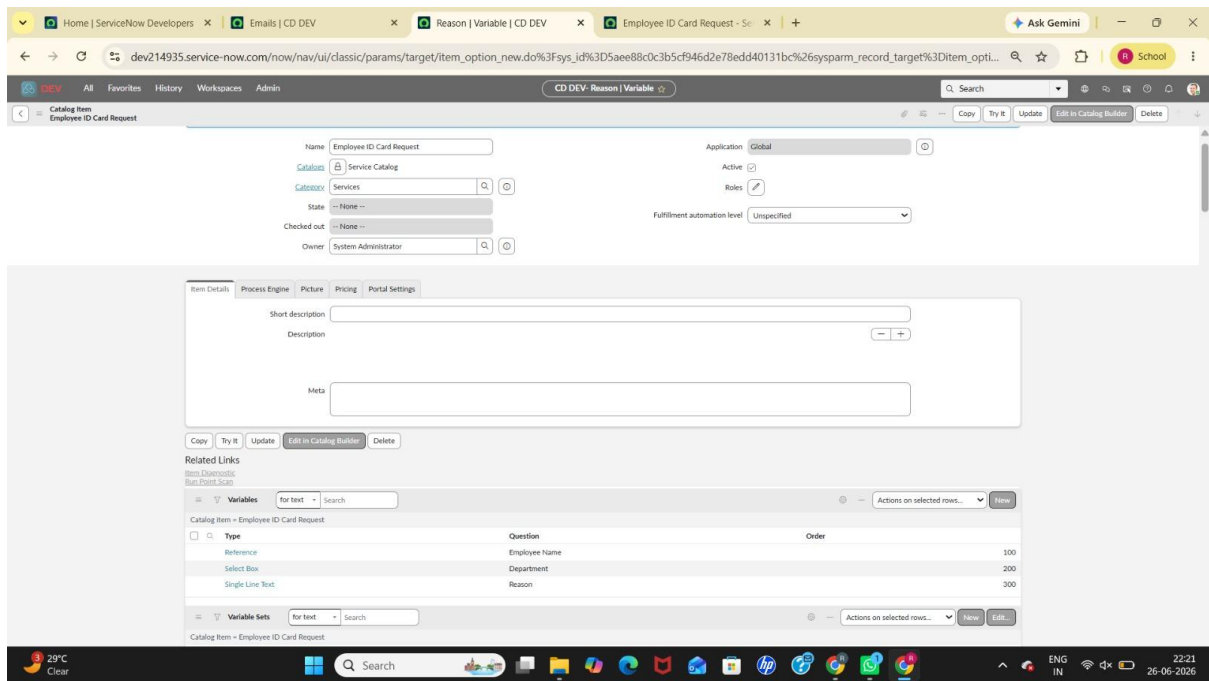

- Employee ID
- Department
- Reason for Request

17. Create a **Flow Designer** workflow that:

- Creates the request record automatically.
- Sends a request submission email to the employee.
- Routes the request to the reporting manager for approval.
- Sends an approval notification if the manager approves the request.
- Sends a rejection notification if the manager rejects the request.
- Assigns approved requests to the HR or Administration team for ID card preparation.
- Updates the request status automatically at each stage.

18. Click **Submit** or **Save** to create and publish the catalog item successfully.

The Employee ID Card Request catalog item provides a streamlined, automated, and user-friendly solution for managing ID card requests while minimizing manual effort, improving approval efficiency, ensuring transparency, and keeping employees informed through automated email notifications throughout the entire request lifecycle.

Purpose of the Catalog

The **Employee ID Card Request** Service Catalog serves as the primary self-service portal through which employees can submit requests related to their employee ID cards. It provides a centralized, secure, and user-friendly interface that standardizes the ID card request process across the organization.

Using the **Employee ID Card Request** catalog item, employees can submit requests for services such as:

- New Employee ID Card
- Replacement ID Card
- Lost ID Card
- Damaged ID Card
- Renewal of Employee ID Card
- Correction of Employee Information on ID Card

After an employee submits a request, the system automatically creates the request record and sends an acknowledgment email confirming that the request has been received. The request is then routed to the employee's **Reporting Manager** through **Flow Designer** for approval.

- If the manager **approves** the request, the system:
 - Sends an approval email to the employee.
 - Assigns the request to the HR or Administration team for ID card generation.
 - Updates the request status to **Approved** and then **In Progress**.

- If the manager **rejects** the request, the system:
 - Sends a rejection email to the employee with the manager's comments.
 - Updates the request status to **Rejected**.

Employees can track the status of their requests through the Service Portal, while HR administrators can monitor all requests using reports and dashboards.

By providing a single point of access for all employee ID card requests, the Service Catalog eliminates manual email-based requests, improves transparency, ensures consistent approvals, and significantly reduces processing time.

6.2 Catalog Variables Configuration

Catalog Variables are used to collect all the necessary information from employees when they submit an Employee ID Card Request. These variables appear as input fields on the Service Catalog form and capture the information required to process, approve, and fulfill the request.

The information entered through these variables is utilized by **Flow Designer**, **Approval Workflows**, **Email Notifications**, and **HR fulfillment processes** throughout the request lifecycle.

Steps to Create Catalog Variables

Follow the steps below to configure Catalog Variables:

19. Open the **Employee ID Card Request** catalog item.
20. Navigate to the **Variables** related list.
21. Click the **New** button to create a new variable.
22. Configure the following properties for each variable:
 - Variable Type
 - Question
 - Name
 - Order
 - Tooltip
 - Help Text
 - Mandatory Status
23. Click **Save** to create the variable.
24. Repeat the above steps until all required variables have been added to the Employee ID Card Request catalog item.

Catalog Variables Used

Variable Name	Variable Type	Purpose
---------------	---------------	---------

Variable Name	Variable Type	Purpose
Employee Name	Single Line Text	Capture the employee's full name.
Department	Reference/Choice	Select the employee's department.

Reason for Request	Multi-line Text	Describe the reason for the request.
--------------------	-----------------	--------------------------------------

Type	Question	Order
Reference	Employee Name	100
Select Box	Department	200
Single Line Text	Reason	300

Variable Configuration

The **Employee ID Card Request** catalog item consists of different types of catalog variables that collect all the information required to process an employee's ID card request. These variables are carefully selected based on the type of information needed for request validation, manager approval, HR processing, and automated workflow execution.

Types of Variables Used

1. Reference Variable

A **Reference Variable** retrieves data from an existing Service Now table, eliminating duplicate data entry and improving data consistency.

Examples:

- Reporting Manager → User (sys_user) Table
- Department → Department Table

Purpose:

The Reporting Manager selected in this variable receives the approval request automatically through Flow Designer.

2. Choice Variable

A **Choice Variable** allows employees to select one option from a predefined list.

Example:**Request Type**

Available options include:

- New Employee ID Card
- Replacement ID Card
- Lost ID Card
- Damaged ID Card
- Renewal of Employee ID Card
- Correction of Employee Information

3. Single Line Text

Used to capture short text values.

Examples:

- Employee ID
- Employee Name
- Designation
- Office Location

4. Multi-Line Text

Used when employees need to provide detailed information.

Examples:

- Reason for Request
- Additional Comments

Purpose:

Allows employees to explain why they are requesting a new, replacement, or updated ID card.

5. Attachment Variable

Allows employees to upload supporting documents.

Examples:

- Passport Size Photograph
- Identity Proof
- HR Authorization Letter
- Lost ID Declaration
- Police Complaint Copy (if applicable)

6. Email Variable

Stores the employee's official email address.

Purpose:

The email address is used to send automated notifications when:

- Request is submitted
- Request is pending manager approval
- Request is approved
- Request is rejected
- ID card is generated
- Request is completed

Auto-Populated Variables

To improve efficiency, several fields are automatically populated using **Dot Walking** from the **User (sys_user)** table. Once the employee selects or logs into the Service Portal, the system automatically retrieves related user information.

The automatically populated fields include:

- Employee Name
- Employee ID
- Email Address

This automation minimizes manual input, improves data accuracy, and reduces the possibility of data entry errors.

Advantages of Catalog Variables

The use of Catalog Variables provides several benefits, including:

- Standardized collection of employee information

- Improved accuracy of submitted data
- Reduced manual data entry through auto-populated fields
- Simplified approval workflow automation
- Faster request processing
- Better reporting and audit management
- Automatic routing to the Reporting Manager
- Automatic email notifications for approval and rejection
- Improved employee experience through real-time request tracking

The screenshot shows a configuration interface for a 'Question' tab. At the top, there are several tabs: 'Question', 'Annotation', 'Type Specifications', 'Default Value', 'Auto-populate', 'Permission', and 'Availability'. Below the tabs, a blue instruction bar reads: 'Specify the Question that explains the options available to the end user when ordering the item'. The main form contains several input fields:

- * Question: Employee Name
- * Name: employee_name
- Conversational label: (empty)
- Tooltip: (empty)
- Example Text: (empty)

 A 'Submit' button is located at the bottom left of the form area.

6.3 Variable Set Configuration

A **Variable Set** is a reusable collection of catalog variables that can be attached to multiple catalog items. Instead of creating the same variables repeatedly, developers can create them once and reuse them wherever necessary, improving consistency, maintainability, and reducing development effort.

For the **Employee ID Card Request** project, a Variable Set is created to capture common employee information that may also be reused in other HR Service Catalog items.

Common Variables Included in the Variable Set

- Employee Name
- Department
- Reason

Using this Variable Set ensures that the same employee information is consistently captured across multiple HR requests.

Steps to Create a Variable Set

25. Open the **Application Navigator**.
26. Navigate to:
Service Catalog → Variable Sets
27. Click **New** to create a Variable Set.

28. Enter the required information:

- Name: **Employee Information**
- Description: **Reusable employee details for HR Service Catalog requests.**

29. Add all the required variables to the Variable Set.

30. Click **Save**.

31. Associate the Variable Set with the **Employee ID Card Request** catalog item.

32. Publish the catalog item.

Using Variable Sets reduces duplication, improves consistency, simplifies future maintenance, and enables rapid development of additional HR service catalog applications while ensuring accurate employee information is available for approvals, notifications, and workflow automation.

The screenshot shows the ServiceNow Catalog Builder interface for the 'Employee ID Card Request' catalog item. The top navigation bar includes 'Home | ServiceNow Developers', 'Emails | CD DEV', 'Catalog Items | CD DEV', and 'Employee ID Card Request'. The main content area is divided into two sections. The top section contains fields for 'Name' (Employee ID Card Request), 'Application' (Global), 'Active' (checked), 'Roles' (empty), 'State' (None), 'Checked out' (None), 'Owner' (System Administrator), and 'Fulfillment automation level' (Unspecified). The bottom section is titled 'Item Details' and includes tabs for 'Process Engine', 'Picture', 'Pricing', and 'Portal Settings'. It contains a 'Short description' field, a 'Description' field, and a 'Meta' field. Below these fields are buttons for 'Copy', 'Try It', 'Update', 'Edit in Catalog Builder', and 'Delete'. A 'Related Links' section is also visible, showing a link to 'Item Details'. At the bottom, there is a 'Variables' section with a search bar and a table with columns 'Type', 'Question', and 'Order'. The table contains one row with 'Reference' as the type and 'select employee name' as the question.

Advantages of Variable Sets

Using **Variable Sets** in the **Employee ID Card Request** application provides several advantages during development and maintenance:

- Eliminates repetitive configuration by reusing common employee information variables across multiple HR catalog items.
- Simplifies maintenance because changes made to the Variable Set are automatically reflected in all associated catalog items.
- Provides a consistent user experience across Employee Service catalog requests.
- Enables common employee details such as Employee ID, Employee Name, Department, Designation, Email Address, and Reporting Manager to be reused.
- Reduces application development time and improves implementation efficiency.

- Ensures standardized data collection for all employee-related requests.
- Improves workflow automation by supplying consistent data to Flow Designer.
- Reduces manual errors and duplicate configuration.
- Supports future HR applications such as Employee Onboarding, Access Requests, and Asset Requests using the same Variable Set.

6.4 Catalog UI Policy Configuration

Catalog UI Policies are used to make the **Employee ID Card Request** form more interactive by controlling the visibility, mandatory status, and read-only behavior of catalog variables based on user selections. These policies help create dynamic request forms that display only the fields required for the selected request type.

In this project, Catalog UI Policies are configured to automatically show or hide specific variables according to the employee's selected **Request Type**. This makes the form easier to complete, reduces unnecessary data entry, and improves the overall user experience.

Objective

The implementation of Catalog UI Policies is intended to achieve the following objectives:

- Improve the usability and appearance of the Employee ID Card Request form.
- Display only the fields relevant to the selected request type.
- Dynamically show or hide variables based on employee selections.
- Make fields mandatory only when required.
- Prevent incomplete or incorrect request submissions.
- Reduce manual validation performed by HR.
- Improve data quality before the request enters the approval workflow.

Example Scenarios

The Catalog UI Policies respond dynamically to user input.

Scenario 1 – Lost ID Card

If the employee selects:

Request Type = Lost ID Card

The following fields become visible:

- Date ID Card Was Lost

- Description of Loss
- Upload Police Complaint (Optional)

Scenario 2 – Replacement ID Card

If the employee selects:

Request Type = Replacement ID Card

The following fields become visible:

- Reason for Replacement
- Upload Damaged ID Card Photo

SIGNATURE AUTOMATICALLY SAVED THE CHANGES ON SCREEN
context

Question

Type Specifications

Default Value

Auto-populate

Permission

Availability

Specify the Question that explains the options available to the end user when ordering the item

* Question

Department

* Name

department

Conversational label

Tooltip

Copy

Update

Delete

Scenario 3 – Correction of Employee Information

If the employee selects:

Request Type = Correction of Employee Information

The following fields become mandatory:

- Correct Employee Name
- Correct Department
- Correct Designation
- Supporting HR Document

Scenario 4 – New Employee ID Card

If the employee selects:

Request Type = New Employee ID Card

The following fields are displayed:

- Passport Size Photograph
- Joining Date
- Employee ID
- Department
- Office Location

This dynamic behavior ensures employees see only the fields applicable to their request, making the form simpler and reducing errors.

The screenshot displays the ServiceNow Flow Designer interface for the 'Employee ID Card Request' application. The top navigation bar shows the application name and the current configuration step. The main configuration area includes a 'Question' configuration for 'Department' with a 'Select Box' type. Below the configuration, there is a 'Question Choices' table listing departments: IT, FINANCE, HR, and MARKETING, each with a value and an order.

Question	Value	Order	Inactive
IT	1	100	false
FINANCE	2	200	false
HR	3	300	false
MARKETING	4	400	false

Flow designer

Implementing in the **Employee ID Card Request** application provides several advantages in improving the overall functionality and usability of the Service Catalog:

- Creates dynamic and interactive Employee ID Card Request forms.
- Displays only the fields relevant to the selected Request Type.
- Enhances the overall employee experience.
- Maintains a clean and organized request form.
- Reduces unnecessary data entry.
- Makes fields mandatory only when applicable.
- Minimizes validation errors during form submission.

- Improves the quality and accuracy of employee information.
- Supports faster manager approvals by ensuring complete request details.
- Enables seamless workflow automation through Flow Designer.

Table Details

Table Name: Employee ID Card Request

Purpose:

To centrally store and manage all submitted Employee ID Card Requests, including employee information, approval status, request type, assigned HR personnel, request history, and fulfillment details.

Open the **Application Navigator**.

Navigate to:

System Definition → **Tables**

Click **New** to create a new table.

Enter the required information:

- Label
- Table Name
- Application

Enable **Auto Generate Schema**.

Click **Submit** to create the custom table.

Field Creation

After creating the custom table, the required fields were added to store the information collected through the Employee ID Card Request catalog item. Each table field corresponds to a catalog variable, ensuring that all request information is stored systematically.

These fields are later used by Flow Designer, approval workflows, email notifications, reports, and HR fulfillment activities.

Steps to Create Table Fields

33. Open the **Employee ID Card Request** custom table.
34. Navigate to the **Columns** tab.
35. Click **New**.
36. Select the required **Field Type**.
37. Enter the **Column Label**.

38. Specify the **Column Name**.
39. Save the field.
40. Repeat the process until all required fields are created.

Fields Created

Field Name	Data Type
------------	-----------

Employee ID	String
-------------	--------

Employee Name	String
---------------	--------

Department	Reference
------------	-----------

Email Address	Email
---------------	-------

Reason for Request	String
--------------------	--------

Approval Status	Choice
-----------------	--------

HR Assigned To	Reference
----------------	-----------

6.7 Flow Designer Implementation

Flow Designer is the primary automation component used in this project to manage the complete **Employee ID Card Request** lifecycle. It automatically executes a sequence of predefined actions whenever an employee submits an ID Card Request through the Service Catalog.

The flow automates:

- Request creation
- Manager approval
- Approval or rejection email notifications
- HR task assignment
- Status updates

- Request completion notifications

This automation significantly reduces manual work while ensuring every request follows a standardized approval process.

6.7.1 Flow Creation

The first step in implementing automation is to create a new Flow that controls the complete Employee ID Card Request lifecycle.

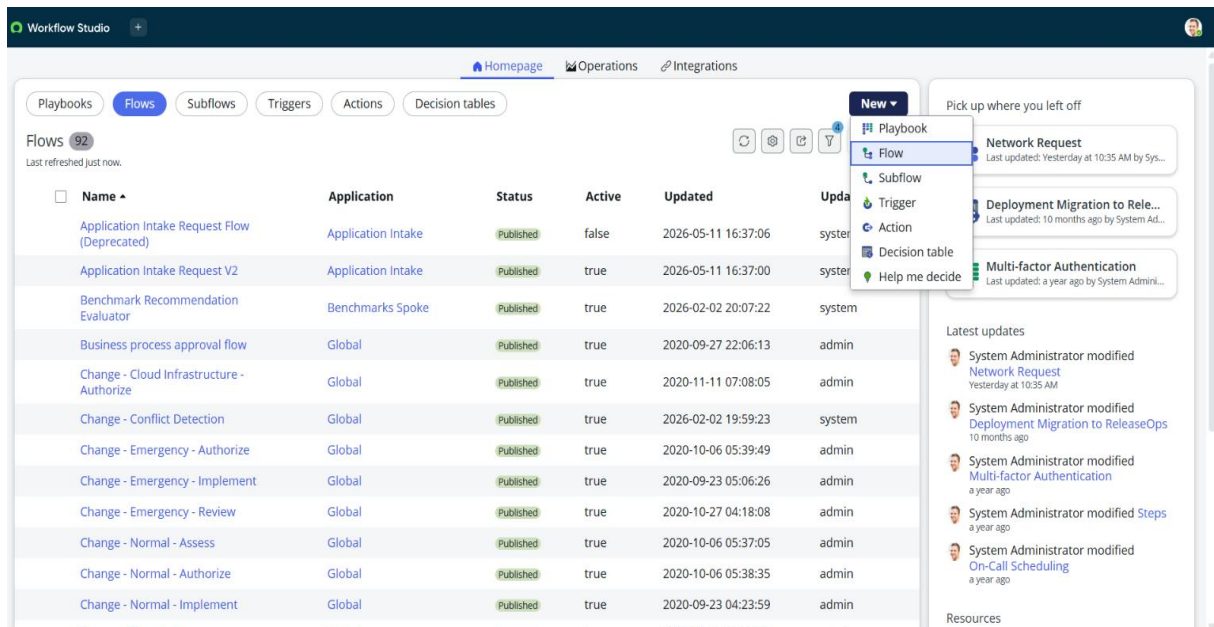

This flow acts as the central automation engine responsible for coordinating approvals, notifications, record updates, HR assignment, and request completion.

Steps to Create the Flow

41. Open the **Application Navigator**.
42. Search for **Flow Designer**.
43. Launch **Flow Designer**.
44. Click **New** and select **Flow**.
45. Enter the required details:
 - **Flow Name:** Employee ID Card Request Management
 - **Description:** Automates the complete Employee ID Card Request process including manager approval, email notifications, HR assignment, and request completion.
46. Click **Build Flow**.
47. Configure the trigger:
 - **Trigger:** Service Catalog Request Submitted
 - **Catalog Item:** Employee ID Card Request
48. Add the following Flow actions in sequence:
 - Create Employee ID Card Request record.
 - Send request submission confirmation email to the employee.
 - Send approval request to the Reporting Manager.
 - Wait for Manager Approval.
 - Decision: Approved or Rejected.
49. If **Approved**:
 - Update Approval Status to **Approved**.
 - Send approval email to the employee.
 - Assign the request to the HR or Administration team.
 - Update Request Status to **In Progress**.
 - After ID card preparation, update Request Status to **Completed**.
 - Send ID Card Issued/Completed email to the employee.
50. If **Rejected**:
 - Update Approval Status to **Rejected**.
 - Capture the manager's rejection comments.

- Send rejection email to the employee including the rejection reason.
- Close the request automatically.

This automated workflow ensures that every Employee ID Card Request is processed consistently, provides complete visibility throughout the request lifecycle, minimizes manual intervention, improves SLA compliance, and keeps employees informed through automated email notifications at every stage of the process.

Flow designer

Implementing in the **Employee ID Card Request** application provides several advantages in improving the overall functionality and usability of the Service Catalog:

- Creates dynamic and interactive Employee ID Card Request forms.
- Displays only the fields relevant to the selected Request Type.
- Enhances the overall employee experience.
- Maintains a clean and organized request form.
- Reduces unnecessary data entry.
- Makes fields mandatory only when applicable.
- Minimizes validation errors during form submission.
- Improves the quality and accuracy of employee information.
- Supports faster manager approvals by ensuring complete request details.
- Enables seamless workflow automation through Flow Designer.

6.7 Flow Designer Implementation

Flow Designer is the primary automation component used in this project to manage the complete **Employee ID Card Request** lifecycle. It automatically executes a sequence of predefined actions whenever an employee submits an ID Card Request through the Service Catalog.

The flow automates:

- Request creation
- Manager approval
- Approval or rejection email notifications
- HR task assignment
- Status updates
- Request completion notifications

This automation significantly reduces manual work while ensuring every request follows a standardized approval process.

6.7.1 Flow Creation

The first step in implementing automation is to create a new Flow that controls the complete Employee ID Card Request lifecycle.

This flow acts as the central automation engine responsible for coordinating approvals, notifications, record updates, HR assignment, and request completion.

Steps to Create the Flow

51. Open the **Application Navigator**.
52. Search for **Flow Designer**.
53. Launch **Flow Designer**.
54. Click **New** and select **Flow**.
55. Enter the required details:
 - **Flow Name:** Employee ID Card Request Management
 - **Description:** Automates the complete Employee ID Card Request process including manager approval, email notifications, HR assignment, and request completion.
56. Click **Build Flow**.
57. Configure the trigger:
 - **Trigger:** Service Catalog Request Submitted
 - **Catalog Item:** Employee ID Card Request
58. Add the following Flow actions in sequence:
 - Create Employee ID Card Request record.
 - Send request submission confirmation email to the employee.

- Send approval request to the Reporting Manager.
- Wait for Manager Approval.
- Decision: Approved or Rejected.

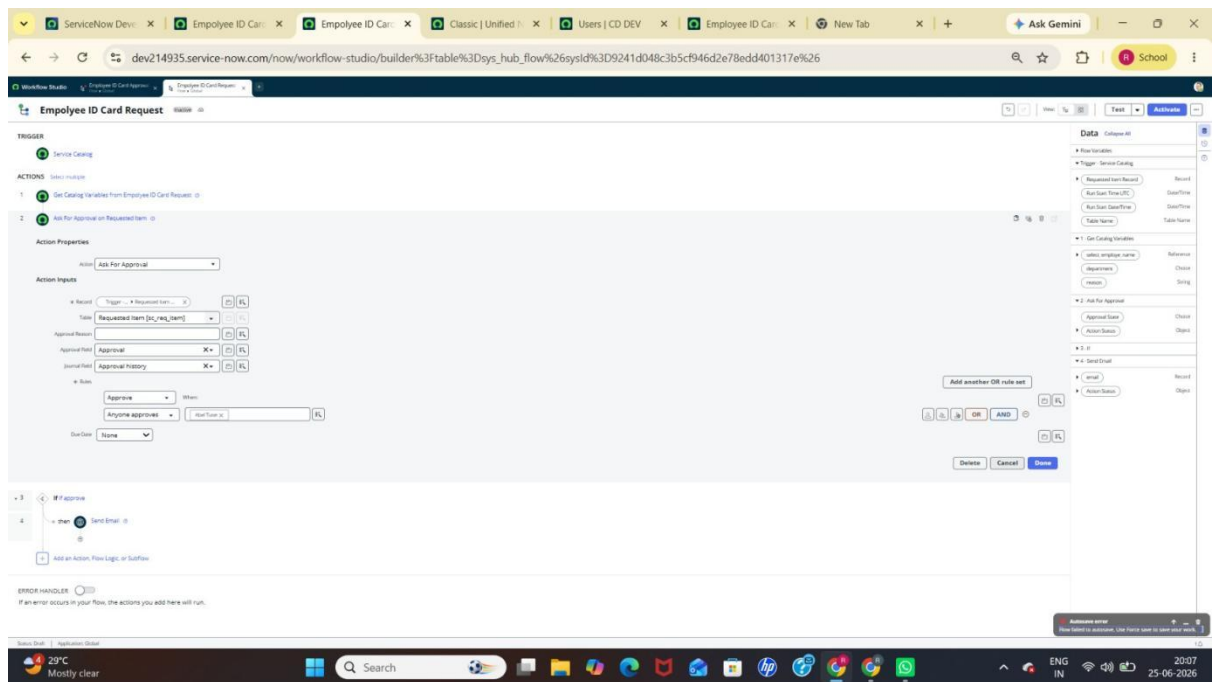

59. If **Approved**:

- Update Approval Status to **Approved**.
- Send approval email to the employee.
- Assign the request to the HR or Administration team.
- Update Request Status to **In Progress**.
- After ID card preparation, update Request Status to **Completed**.
- Send ID Card Issued/Completed email to the employee.

60. If **Rejected**:

- Update Approval Status to **Rejected**.
- Capture the manager's rejection comments.
- Send rejection email to the employee including the rejection reason.
- Close the request automatically.

This automated workflow ensures that every Employee ID Card Request is processed consistently, provides complete visibility throughout the request lifecycle, minimizes manual intervention, improves SLA compliance, and keeps employees informed through automated email notifications at every stage of the process.

1.

6.7.2 Flow Logic and Actions

The **Employee ID Card Request** flow is designed using **ServiceNow Flow Designer** to automate the complete employee ID card request process. The workflow starts when an employee submits an **Employee ID Card Request** through the Service Catalog. The flow retrieves the submitted information, routes the request to the reporting manager for approval, sends email notifications, and creates a task for the HR or Administration team upon approval.

Flow Sequence

Step 1: Service Catalog Trigger

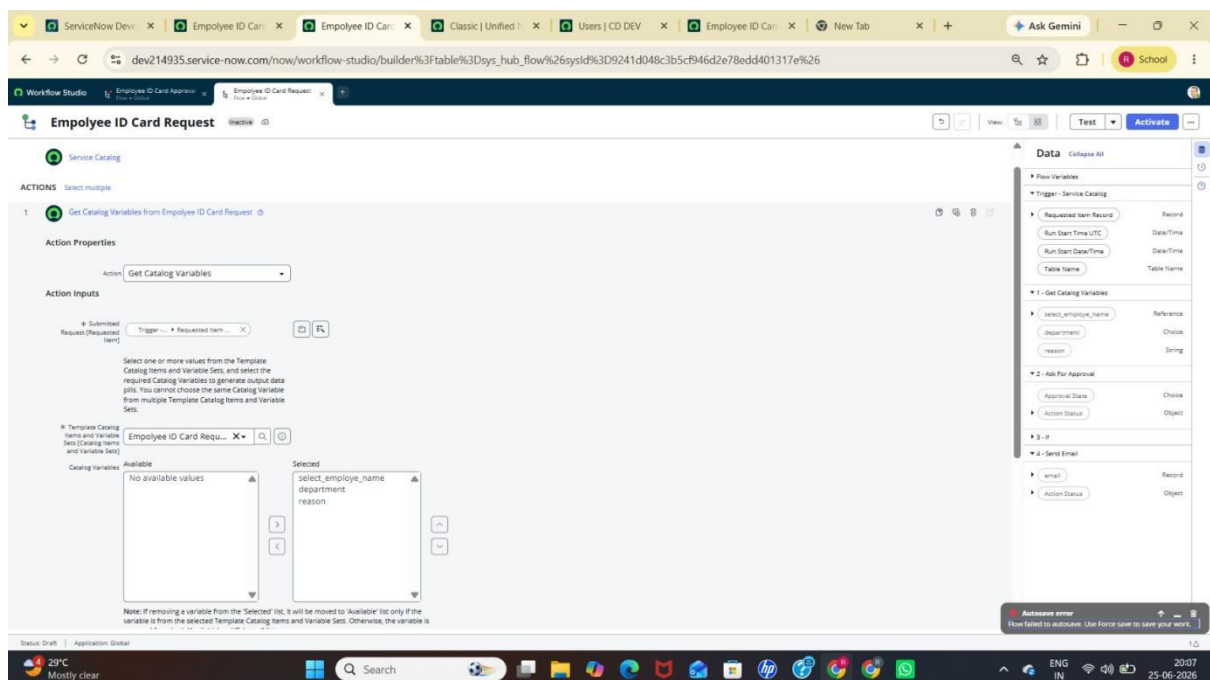

The flow is triggered automatically when an employee submits the **Employee ID Card Request** catalog item through the Service Catalog.

Trigger: Service Catalog

Catalog Item: Employee ID Card Request

Step 2: Get Catalog Variables

The **Get Catalog Variables** action retrieves the information entered by the employee in the request form.

The variables captured include:

- Employee Name
- Department
- Reason for Request

These values are used in subsequent actions such as approval processing, email notifications, and task creation.

Step 3: Ask for Approval

The **Ask For Approval** action automatically sends the request to the employee's **Reporting Manager** for review.

The manager can either:

- Approve the request
- Reject the request

The approval decision is recorded in the request history and the request status is updated automatically.

Step 4: Approval Decision

The flow evaluates the manager's decision using an **If** condition.

If Approved

When the manager approves the request:

- The approval status is updated to **Approved**.
- An approval email is automatically sent to the employee.
- A task is created for the **HR or Administration Team** to generate and issue the employee ID card.

If Rejected

When the manager rejects the request:

- The approval status is updated to **Rejected**.
- A rejection email is automatically sent to the employee.
- The workflow ends without creating an HR task.

Step 5: Send Email

The **Send Email** action notifies the employee about the approval decision.

Approval Email

Subject: Employee ID Card Request Approved

Message:

Dear Employee,

Your Employee ID Card Request has been approved by your Reporting Manager.

Your request has been forwarded to the HR/Administration team for further processing.

Thank you.

Rejection Email

Subject: Employee ID Card Request Rejected

Message:

Dear Employee,

Your Employee ID Card Request has been rejected by your Reporting Manager.

Please contact your Reporting Manager or the HR department for additional information.

Thank you.

Step 6: Create Task Record

After the request is approved, the flow automatically executes the **Create Task Record** action.

The task is created in the **Task [task]** table and assigned to the HR or Administration team responsible for preparing the employee ID card.

Task Details

- **Table:** Task (task)
- **Assigned To:** HR/Administration User
- **Short Description:** Employee ID Card Request – Create Employee ID Card
- **Task Status:** Open

The task contains the employee request details, enabling the HR team to process the request efficiently.

Benefits of the Flow

The automated workflow provides several advantages:

- Eliminates manual approval processing.
- Automatically routes requests to the Reporting Manager.
- Sends approval and rejection email notifications.
- Automatically creates HR tasks after approval.
- Reduces manual effort and processing time.
- Maintains complete request history and audit trail.
- Improves transparency and employee satisfaction.

- Ensures consistent processing of Employee ID Card Requests.
- Supports SLA compliance through automated workflow execution.

Overall Workflow

61. Employee submits an Employee ID Card Request.
62. Flow Designer retrieves the submitted catalog variables.
63. The request is sent to the Reporting Manager for approval.
64. The manager approves or rejects the request.
65. If approved:
 - Approval email is sent to the employee.
 - An HR task is created automatically for ID card generation.
66. If rejected:
 - Rejection email is sent to the employee.
 - The workflow ends.
67. HR completes the task and issues the employee ID card.

6.7.5 Approval Process

To ensure that network requests are processed only after proper authorization, an **Approval Process** is incorporated into the workflow. Once a request record is created, it is automatically forwarded to the designated approver, such as a **Manager** or **Network Administrator**, for review and decision.

This approval mechanism helps maintain organizational policies, improves accountability, and ensures that only valid requests proceed to the next stage of processing.

Steps to Configure the Approval Process

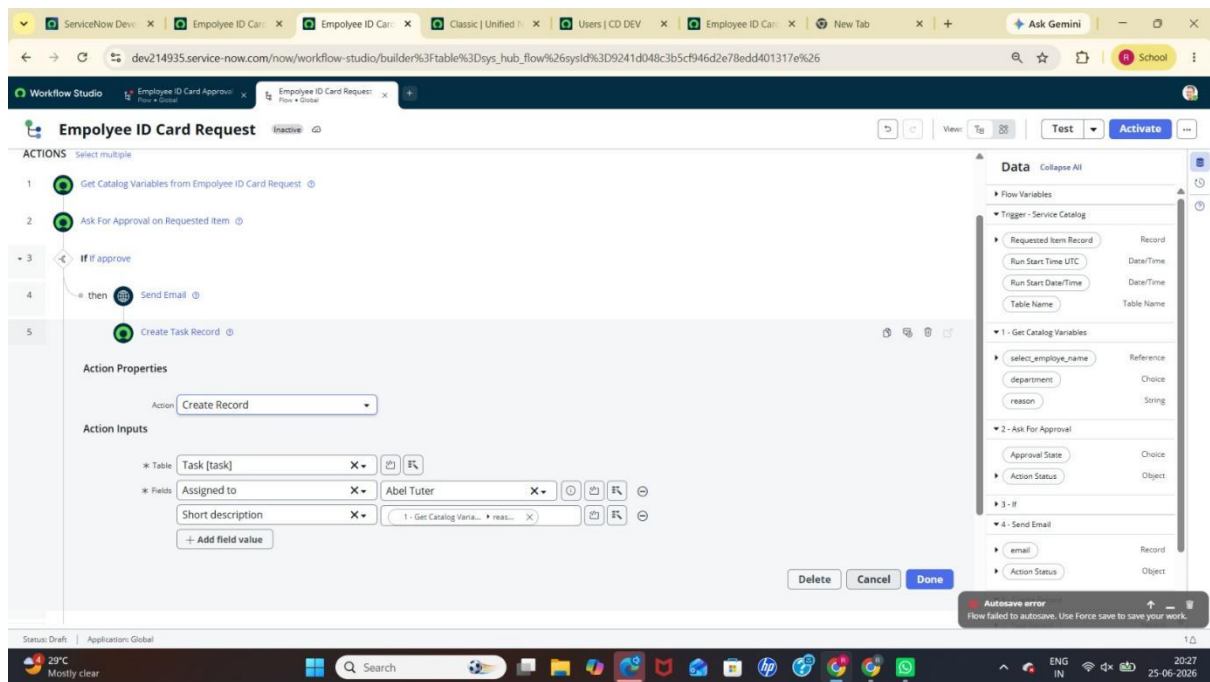

1. Click **Add Action** in the Flow Designer.
2. Select the **Ask for Approval** action.
3. Choose the newly created **Network Database** record as the target record.
4. Configure the required approval rule.
5. Specify the appropriate approver (Manager or Network Administrator).
6. Enter the approval reason and save the configuration.

Approval Outcomes

After the approver reviews the request, one of the following outcomes is recorded:

- **Approved**
- **Rejected**
- **Pending**

ServiceNow automatically records the approval history, including the approver's decision and status, providing a complete audit trail for every network request.

6.8 Service Portal (Home Page)

The **Service Portal** serves as the primary self-service interface for employees to access IT and HR services within the ServiceNow platform. It provides a centralized and user-friendly environment where users can search for services, submit requests, track request status, access knowledge articles, and view announcements.

In the **Employee ID Card Request** project, the Service Portal acts as the entry point for employees to submit ID card requests. Employees can browse the Service Catalog, select the **Employee ID Card Request** catalog item, complete the required form, and submit the request for manager approval. The portal also enables employees to monitor the status of their requests and receive updates throughout the request lifecycle.

Purpose of the Service Portal

The Service Portal provides employees with a centralized platform to:

- Submit Employee ID Card Requests.
- Access the Service Catalog.
- Search for available services.
- View request status and history.
- Access Knowledge Base articles.
- Receive important announcements.
- View pending approvals (for managers).
- Monitor open incidents and service requests.

Features Available on the Home Page

The Service Portal Home Page includes the following components:

Search Bar

A global search bar allows users to quickly search for:

- Employee ID Card Request
- Service Catalog Items

Request Something

The **Request Something** section provides access to all available Service Catalog items.

Employees can:

- Submit Employee ID Card Requests.
- Browse available HR and IT services.
- Access organization-approved service offerings.

Role of the Service Portal in the Employee ID Card Request Project

The Service Portal is an essential component of the Employee ID Card Request application. It provides employees with a simple and intuitive interface for initiating and tracking their requests.

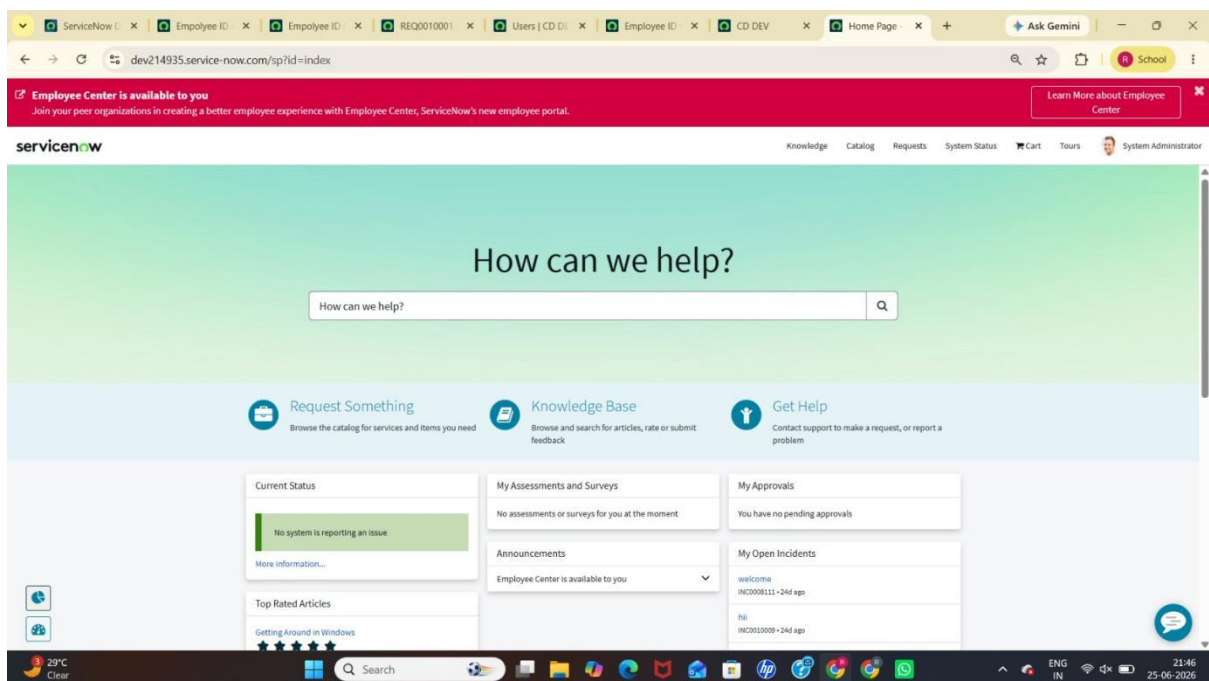

The request process follows these steps:

1. Employee logs into the Service Portal.
2. Selects **Request Something** from the home page.
3. Opens the **Employee ID Card Request** catalog item.
4. Enters the required employee information.
5. Submits the request.
6. The request is automatically routed to the Reporting Manager for approval using Flow Designer.
7. After approval, an email notification is sent to the employee.
8. A task is automatically created for the HR or Administration team to prepare the employee ID card.
9. If the request is rejected, a rejection email is automatically sent to the employee.
10. Employees can track the request status from the Service Portal until the ID card is issued.

Benefits of the Service Portal

- Provides a centralized self-service platform.
- Simplifies Employee ID Card Request submission.
- Improves user experience with an intuitive interface.
- Reduces manual communication through automated workflows.
- Enables real-time request tracking.
- Supports manager approvals directly within ServiceNow.
- Provides access to Knowledge Base articles and support resources.
- Enhances transparency throughout the request lifecycle.
- Improves operational efficiency through automation.
- Increases employee satisfaction by providing timely updates and faster request processing.

This content matches the Service Portal screen shown in your screenshot and fits naturally into your **Employee ID Card Request in ServiceNow** project documentation.

6.9 Searching the Employee ID Card Request Catalog Item

The **ServiceNow Service Portal** provides a search feature that enables employees to quickly locate available catalog items. In this project, employees can search for the **Employee ID Card Request** catalog item by entering keywords such as **Employee ID Card Request** in the search bar.

The search results display the matching catalog item, allowing employees to access the request form without navigating through multiple catalog categories. This improves

accessibility, reduces the time required to locate services, and enhances the overall user experience.

Steps to Search the Employee ID Card Request

1. Log in to the **ServiceNow Service Portal**.
 2. Navigate to the **Home Page**.
 3. Click the **Search** box located at the top of the portal.
 4. Enter **Employee ID Card Request**.
 5. Press **Enter** or click the **Search** icon.
 6. The **Employee ID Card Request** catalog item appears in the search results.
 7. Click the catalog item to open the request form.
 8. Fill in the required employee details and submit the request.
-

Purpose of the Search Feature

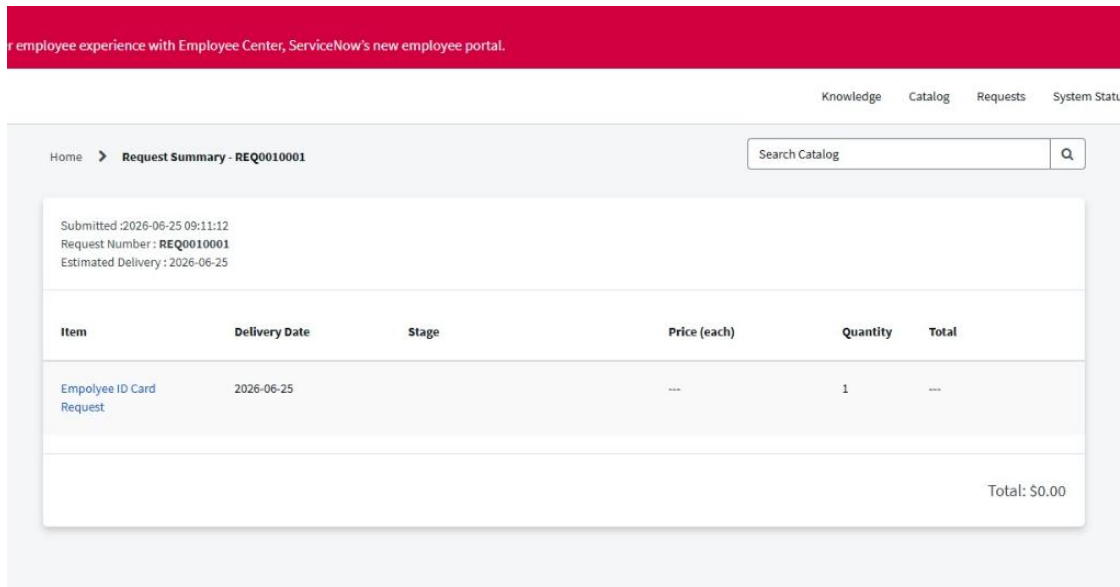

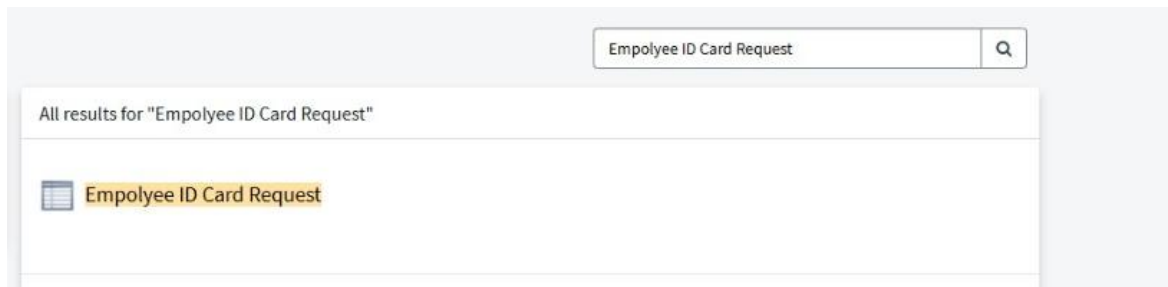

The search functionality is designed to:

- Quickly locate the Employee ID Card Request catalog item.
- Reduce the time required to find services.
- Improve navigation within the Service Portal.
- Provide easy access to HR service requests.
- Enhance employee productivity through a simple search interface.

Benefits

- Faster access to the Employee ID Card Request form.
- User-friendly search experience.
- Reduced navigation effort.
- Improved accessibility to Service Catalog items.
- Increased efficiency in submitting employee requests.
- Better overall employee experience within the ServiceNow Service Portal.

This section accurately describes the screen shown in your image, where the **Employee ID Card Request** catalog item is displayed as the search result in the ServiceNow Service Portal.

6.10 Employee ID Card Request Summary

After an employee submits the **Employee ID Card Request** through the Service Catalog, ServiceNow automatically generates a **Request Summary** page. This page provides confirmation that the request has been successfully submitted and displays important information related to the request.

The Request Summary allows employees to verify their submitted request details and monitor the progress of the request throughout its lifecycle. It also provides a unique request number that can be used for tracking and future reference.

Information Displayed in the Request Summary

The Request Summary page includes the following details:

- **Submission Date:** Displays the date and time when the request was submitted.
- **Request Number:** A unique request identifier automatically generated by ServiceNow.

- **Estimated Delivery Date:** Displays the expected completion or ID card issuance date.
- **Catalog Item:** Employee ID Card Request.
- **Request Stage:** Displays the current stage of the request (Submitted, Pending Approval, Approved, In Progress, Completed, or Rejected).
- **Quantity:** Displays the number of requested items.
- **Request Status:** Allows employees to monitor the current progress of their request.

Purpose of the Request Summary

The Request Summary page is designed to:

- Confirm successful submission of the Employee ID Card Request.
- Display all important request details in one location.
- Provide a unique request number for future tracking.
- Allow employees to monitor the request lifecycle.
- Improve transparency during the approval and fulfillment process.

Workflow After Submission

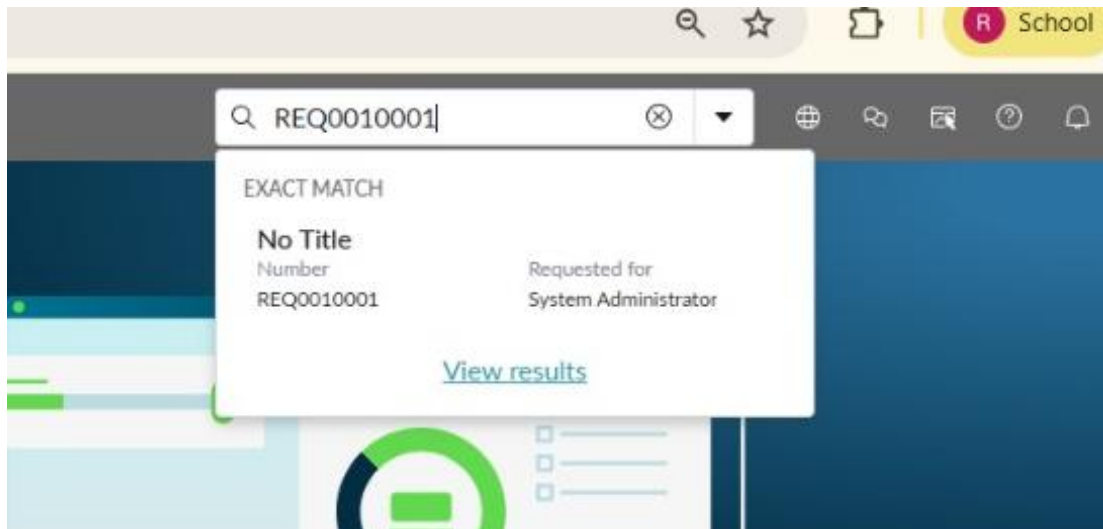

Once the Employee ID Card Request is submitted, the following automated workflow is executed:

1. The request is successfully created in ServiceNow.
2. A unique Request Number (REQ) is generated automatically.
3. The request is routed to the Reporting Manager for approval through Flow Designer.
4. The employee receives an email confirming that the request has been submitted.
5. The manager reviews and either approves or rejects the request.
6. If approved, an approval email is sent to the employee.
7. A task is automatically created and assigned to the HR or Administration team to prepare the Employee ID Card.
8. After the ID card is prepared, the request status is updated to **Completed**, and the employee receives a final notification.

Benefits of the Request Summary

- Confirms successful request submission.
- Displays all request information in a centralized view.
- Provides a unique Request Number for tracking.
- Enables employees to monitor request progress.
- Improves transparency throughout the approval process.
- Reduces the need for manual follow-up with HR or the Reporting Manager.
- Enhances the overall employee experience by providing real-time visibility into the request status.

This section accurately describes the **Request Summary** page shown in your screenshot and aligns with your **Employee ID Card Request in ServiceNow** project.

6.11 Searching the Employee ID Card Request Using Request Number

After submitting an **Employee ID Card Request**, ServiceNow automatically generates a unique **Request Number (REQ)** for every request. Employees, managers, and administrators can use this request number to quickly search for and access the request record using the **Global Search** feature.

The Global Search provides a fast and convenient way to locate requests without manually navigating through menus. It displays the matching request record along with basic information such as the request number and the employee who submitted the request.

Purpose of the Global Search

The Global Search feature enables users to:

- Search for Employee ID Card Requests using the Request Number.
- Quickly locate submitted requests.
- View request details without browsing through multiple modules.
- Improve efficiency in request tracking and management.
- Provide easy access for administrators and managers.

Steps to Search for a Request

1. Log in to the ServiceNow instance.
2. Click the **Global Search** box at the top of the page.
3. Enter the generated **Request Number** (for example, **REQ0010001**).

4. Press **Enter** or select the matching result.
5. ServiceNow displays the matching Employee ID Card Request record.
6. Open the request to view its complete details and current status.

Information Displayed in the Search Result

The search result displays key information related to the request, including:

- **Request Number:** REQ0010001
- **Requested For:** Employee Name
- **Request Record:** Employee ID Card Request
- **Search Result Link:** View Results

Selecting the record opens the complete request details, including approval status, workflow history, assigned tasks, and request progress.

Benefits of Global Search

The Global Search feature provides several advantages:

- Quickly locates Employee ID Card Requests using the Request Number.
- Reduces the time required to find request records.
- Improves productivity for employees, managers, and administrators.
- Provides quick access to request information.
- Simplifies request monitoring and tracking.
- Enhances overall user experience within the ServiceNow platform.
- Supports faster issue resolution by allowing administrators to locate requests instantly.

Role in the Employee ID Card Request Workflow

The Global Search feature plays an important role in the Employee ID Card Request process. Once a request is submitted, a unique Request Number is generated automatically. This number can be used throughout the request lifecycle to monitor its progress. Employees can use it to track their requests, managers can review pending approvals, and administrators or HR personnel can quickly locate the request to process, update, or verify its status. This ensures efficient request management, better transparency, and improved service delivery.

6.12 Employee ID Card Request Record

After an employee submits the **Employee ID Card Request**, ServiceNow automatically creates a **Request (REQ)** record to manage and track the request throughout its lifecycle. This record stores all the information related to the submitted request, including employee details, request status, approval status, and the associated Request Item (RITM).

The Request Record acts as the central record for monitoring the request and enables administrators, managers, and HR personnel to view, update, and process the request efficiently.

Purpose of the Request Record

The Request Record is created to:

- Store all Employee ID Card Request information.
- Generate a unique Request Number.
- Track the approval workflow.
- Monitor the request status.
- Maintain request history for auditing purposes.
- Link the Request (REQ) with the corresponding Request Item (RITM).

Information Displayed in the Request Record

The Request Record contains the following details:

- **Request Number:** Unique identifier generated automatically by ServiceNow.
- **Requested For:** Name of the employee who submitted the request.
- **Opened By:** User who created the request.
- **Opened Date:** Date and time the request was submitted.

- **Approval Status:** Displays whether the request is Pending, Approved, or Rejected.
- **Request State:** Indicates the current processing stage of the request.
- **Description:** Additional information provided by the employee.
- **Special Instructions:** Any extra instructions related to the request.
- **Requested Items:** Displays the associated Request Item (RITM) linked to the request.

Requested Item (RITM)

Each Request Record contains one or more **Requested Items (RITM)**. For the Employee ID Card Request, the Requested Item stores the detailed information submitted through the Service Catalog.

The Requested Item includes:

- **RITM Number**
- **Catalog Item:** Employee ID Card Request
- **Quantity**
- **Due Date**
- **Assigned To**
- **Current Stage**
- **Request Status**

The RITM is processed through the configured Flow Designer workflow and is linked to the parent Request (REQ).

Workflow After Request Creation

Once the Request Record is created, the following automated workflow is executed:

1. The employee submits the Employee ID Card Request through the Service Catalog.
2. ServiceNow generates a unique Request Number (REQ).
3. A corresponding Request Item (RITM) is created automatically.
4. The request is routed to the Reporting Manager for approval using Flow Designer.
5. The manager reviews the request and either approves or rejects it.
6. If approved:
 - The Approval Status is updated to **Approved**.
 - An approval email is sent to the employee.
 - A task is automatically created for the HR or Administration team to prepare the employee ID card.
7. If rejected:
 - The Approval Status is updated to **Rejected**.
 - A rejection email is sent to the employee.

Benefits of the Request Record

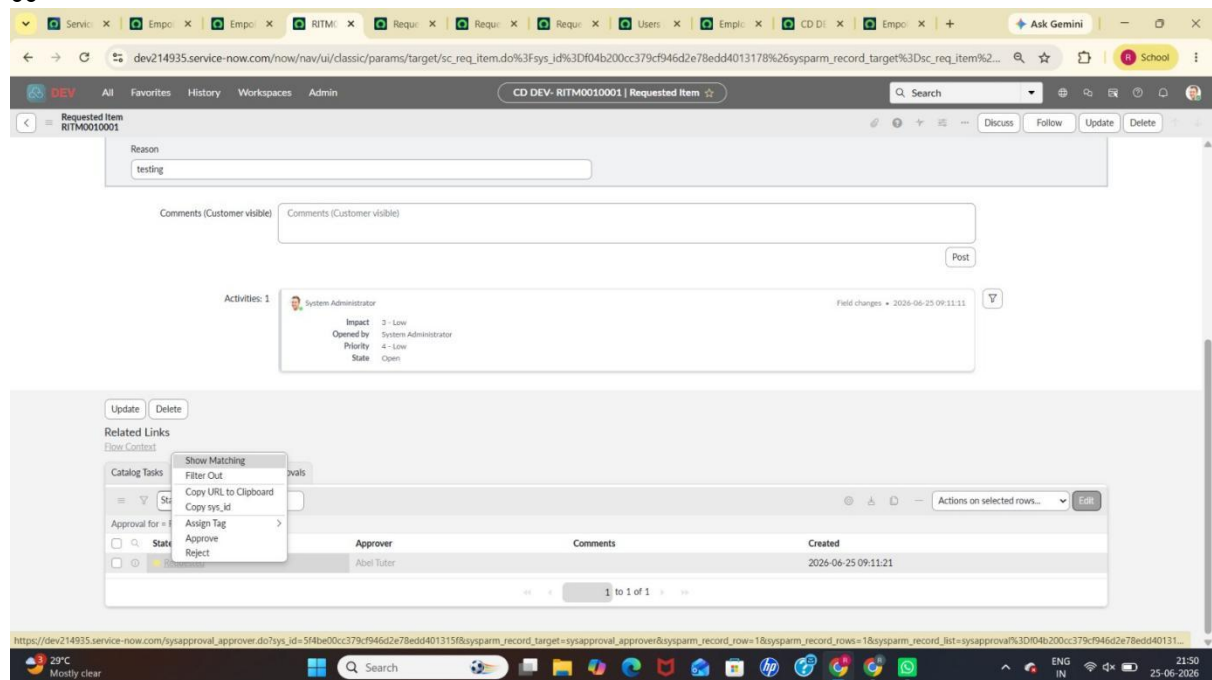

The Request Record provides several benefits:

- Maintains complete information about the Employee ID Card Request.
- Automatically generates a unique Request Number.
- Tracks manager approval status.
- Links the Request with its corresponding Request Item (RITM).
- Enables administrators and HR personnel to monitor request progress.
- Supports reporting, auditing, and compliance.
- Improves transparency throughout the request lifecycle.
- Simplifies request management and follow-up activities.
- Ensures efficient processing through automated workflows.

Role in the Employee ID Card Request Project

The Request Record is a key component of the Employee ID Card Request application. It serves as the central repository for managing employee requests from submission to completion. By integrating with Service Catalog, Flow Designer, Approval Workflows, and Email Notifications, the Request Record enables automated request processing, efficient approval management, and seamless communication between employees, managers, and the HR team, resulting in faster and more reliable Employee ID Card issuance.

The screenshot is low resolution, so most of the text is blurry. Here's the text that is clearly readable:

- **ServiceNow Page:** Requested Item
- **Request Number:** RITM00010001 (appears to be this, but slightly blurry)

- **Reason:** `Testing`
- **Comment Customer Visible**
- **Comments Customer Visible**
- **Activities**
 - **System Administrator**
 - **Opened by:** System Administrator
 - **State:** Open
- **Buttons:**
 - Update
 - Delete
 - Post
- **Related Links**
- **Related Tasks**
- **Columns:**
 - Catalog Task
 - State
 - Approver
 - Comments
 - Created
- **Right-click context menu:**
 - New Window
 - Copy URL UI Clipboard
 - Copy sys_id
 - Assign Tag
 - Approve
 - Reject
- **Actions on selected rows**

The **project title or project name is not visible** in this screenshot because the image resolution is too low.

If you want me to extract **every piece of text** (including the project name, URL, request number, etc.), please upload:

- the **original screenshot** (not compressed), or
- a higher-resolution image (at least 1920×1080).

I can then extract all the text with much better accuracy.

1. System Administrator

- **State:** Approved (was Requested)
- **Field changes:** 2026-06-25 09:20:22

2. System

- **Approver:** Abel Tuter
- **State:** Requested
- **Field changes:** 2026-06-25 09:11:21

Step 1: Open Emails

- Navigate to **System Logs** → **Emails**.

Step 2: Search for the Email

Use the following values in the filter:

- **Target Number:** RITM0010001
- **Target Item:** employee id card request
- **Request:** REQ0010001
- **User:** System Administrator
- **Created:** 2026-06-25 05:29:47 (or search by today's date if needed)

Step 3: Open the Email Record

Click the email record that matches the filters.

Step 4: Verify the Email Details

Check that:

- **Type:** Send-Ready or Sent
- **Recipients:** Correct approver/requester email address
- **Subject:** Contains **Employee ID Card Request** or **Approval**
- **Body:** Contains the approval notification and the correct RITM number (RITM0010001).

Step 5: Confirm the Notification

Verify that:

- The email was generated after the request was approved.
- The notification status is **Sent** (or investigate any error if it failed).

Information visible in your screenshot

Email Notification Verification in ServiceNow

ServiceNow is an IT Service Management (ITSM) platform that automates business processes such as request management, approvals, incident management, and notifications. When a user submits a service request, ServiceNow automatically creates email notifications at different stages of the workflow to keep users and approvers informed.

The **Emails** module under **System Logs** stores all outgoing and incoming email records. Administrators can use this module to verify whether notification emails were generated successfully, check their recipients, subjects, status, and troubleshoot any email delivery issues.

In this project, the request **Employee ID Card Request (RITM0010001)** follows an approval workflow. Whenever the request is created, sent for approval, or approved, ServiceNow generates email notifications automatically. These notifications ensure that all stakeholders receive timely updates about the request status.

Explanation of the Steps

Step 1: Open the Emails Module

Navigate to:

System Logs → Emails

This module displays all email records generated by the ServiceNow instance.

Step 2: Search for the Request

Search using the following details:

- **Requested Item:** RITM0010001
- **Request Number:** REQ0010001
- **Item:** Employee ID Card Request
- **Requested For:** System Administrator

This helps locate all email notifications related to the specific request.

Step 3: Verify Email Notifications

The email records show the notifications generated during the approval process.

The following emails were created:

- **Request REQ0010001 was created**
 - Sent when the request is successfully submitted.
- **Request REQ0010001 was approved**
 - Sent after the approver approves the request.

- **Requested Item RITM0010001 Approval Request**
 - Sent to the assigned approver requesting approval.
- **Your request is approved successfully**
 - Sent to the requester confirming that the request has been approved.

Step 4: Check Email Status

The **Type** column shows **send-ready**, indicating that the email has been generated successfully and is ready to be processed by the email engine.

Administrators can also verify:

- Recipient email address
- Subject line
- Email body
- Creation time
- Delivery status

Conclusion

The Email module in ServiceNow is an essential tool for monitoring notification delivery. It helps administrators verify that approval emails are generated correctly and sent to the appropriate users. In this project, the approval workflow for the **Employee ID Card Request (RITM0010001)** successfully generated all required email notifications, ensuring that both the approver and the requester were informed throughout the approval process.
